Specialists in development and manufacturing of harvesting and processing machines for greenhouse horticulture.

Information

BTM T600 Destacker

The BTM T600 automatically destacks and fills any type of container

The T600 Destacker has been a trusted machine for many years. Manually destacking and filling auction containers can be a demanding and time consuming job. Which is why BTM responded decades ago by developing an automatic destacker for containers and racks.

A machine where full stacks of containers are placed onto a conveyor belt. The belt feeds the stacks into the T600 where the entire stack is lifted. By setting down one container at a time, each can be filled with an adjustable amount of water and if required, additives. If the crop requires racks on the containers, that also belongs to the possibilities. The destacker can be fitted with a rack system, with the racks also fed in stacks on a conveyor belt. The T600 will place every rack precise on the container so there will come ready to use containers out of the machine.

The feed-out of the machine is fully configurable to customer requirements, such as straight out, to the right or left or even both. Even an entire buffer or logistic system is possible.

The BTM T600 therefore save customers many labour hours and avoid unnecessary physical strain.

Specifications

- Up to 600 containers per hour
- Efficient in operation
- Premium materials, long service life
- Remote acces
- Easy to operate
- Highly adjustable
- Significant labour savings
